

DELAWARE COMPENSATION RATING BUREAU, INC.

Retrospective Test of Trend Projections for Severity Ratios

Attached is a retrospective test of the predictive accuracy of various trend procedures. Please note that instead of using ultimate loss ratios, as in Exhibit 6a, Exhibit 6b uses ultimate severity ratios, i.e., ultimate loss ratios adjusted by dividing out the frequency component. The analysis is limited to Policy Years 1989 through 2001, the years for which frequency data is available.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points which permitted a test of the projected loss ratio three years hence were used. Our current review trends 2.9167 years beyond the midpoint of the latest available completed policy year (1/1/2002 to 12/1/2004).

Current estimates of policy year ultimate loss ratios are compared with predicted values based on trending through earlier years. The results are available for each of twenty loss development approaches: incurred, paid-to-2nd through paid-to-20th and the average of the incurred and paid-20th methods.

As an illustration, the incurred loss development approach generated an indemnity severity ratio of 0.3858 for policy year 1997 (page 6b.1). Fitting the severity ratios for policy years 1991 to 1994 using a straight line and projecting that to 1997 yielded a severity ratio of 0.3600 (page 6b.2) which understates our current estimate for 1997 by 0.0258 points (page 6b.3).

Indemnity**Actual Ultimate Severity Ratios**
