DELAWARE COMPENSATION RATING BUREAU, INC.

Retrospective Test of Trend Projections for Severity Ratios – Limited Losses

Attached is a retrospective test of the predictive accuracy of various trend procedures using severity ratios, i.e., ultimate loss ratios adjusted by dividing out the frequency component. The analysis is limited to Policy Years 2000 through 2012, the years for which frequency data is available.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points, which permitted a test of the projected loss ratio three years hence, were used. Our current review trends 2.9167 years beyond the midpoint of the latest available completed policy year (1/1/2013 to 12/1/2015).

Current estimates of policy year ultimate loss ratios are compared with predicted values based on trending through earlier years. The results are available for each of three loss development approaches: incurred, paid-to-24th and the average of the incurred and paid-to-24th methods.

As an illustration, the incurred loss development approach generated an indemnity severity ratio of 0.4380 for policy year 2007 (page 6.1). Fitting the severity ratios for policy years 2001 to 2004 using a straight line and projecting that to 2007 yielded a severity ratio of 0.3697 (page 6.2) which understates our current estimate for 2007 by 0.0683 points (page 6.3).
