DELAWARE COMPENSATION RATING BUREAU, INC.

Retrospective Test of Trend Projections for Severity Ratios – Limited Losses

Attached is a retrospective test of the predictive accuracy of various trend procedures using severity ratios, i.e., ultimate loss ratios adjusted by dividing out the frequency component. The analysis is limited to Policy Years 2001 through 2013, the years for which frequency data is available.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points, which permitted a test of the projected loss ratio three years hence, were used. Our current review trends 2.9167 years beyond the midpoint of the latest available completed policy year (1/1/2014 to 12/1/2016).

Current estimates of policy year ultimate loss ratios are compared with predicted values based on trending through earlier years. The results are available for each of three loss development approaches: incurred, paid-to-25th and the average of the incurred and paid-to-25th methods.

As an illustration, the incurred loss development approach generated an indemnity severity ratio of 0.3933 for policy year 2008 (page 6.1). Fitting the severity ratios for policy years 2002 to 2005 using a straight line and projecting that to 2008 yielded a severity ratio of 0.4038 (page 6.2) which overstates our current estimate for 2008 by 0.0105 points (page 6.3).
