Retrospective Test of Trend Projections for Severity Ratios – Limited Losses

Attached is a retrospective test of the predictive accuracy of various trend procedures using severity ratios, i.e., ultimate loss ratios adjusted by dividing out the frequency component. The analysis is limited to Policy Years 2002 through 2014, the years for which frequency data is available.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations from four to ten data points, which permitted a test of the projected loss ratio three years hence, were used. Our current review trends 2.9167 years beyond the midpoint of the latest available completed policy year (1/1/2015 to 12/1/2017).

Current estimates of policy year ultimate loss ratios are compared with predicted values based on trending through earlier years. The results are available for each of three loss development approaches: incurred, paid-to-26th and the average of the incurred and paid-to-26th methods.

As an illustration, the incurred loss development approach generated an indemnity severity ratio of 0.4482 for policy year 2009 (page 6.1). Fitting the severity ratios for policy years 2003 to 2006 using a straight line and projecting that to 2009 yielded a severity ratio of 0.4085 (page 6.2) which understates our current estimate for 2009 by 0.0397 points (page 6.3).
